5

ABSTRACT

A novel formulation is provided that serves to specifically inhibit the COX-2

mediated inflammatory response in animals. The formulation comprises comprising an

effective amount of component I selected from the group consisting of alpha acids and

beta acids and an effective amount of at least one component II selected from the group

consisting of alpha acids, beta acids, essential oils, fats and waxes, with the proviso that

component I and II are not the same compound. The composition provides specific

inhibition of cyclooxygenase-2 with little or no effect on cyclooxygenase-1.
